

A Universal Internationalization Tool for Pentaho products

Goal: Create a tool to make it extremely easy to contribute localized property bundles for all Pentaho products

Lots still to do:

- update config to handle entire bi-platform, pillars and client tools
- support unicode characters
- better save functionality, including svn patch generation
- implement web version using gwt-xul
- package up all config files so you don't have to have all the projects checked out
- and more!
